Your AI Agents Are Open-Loop

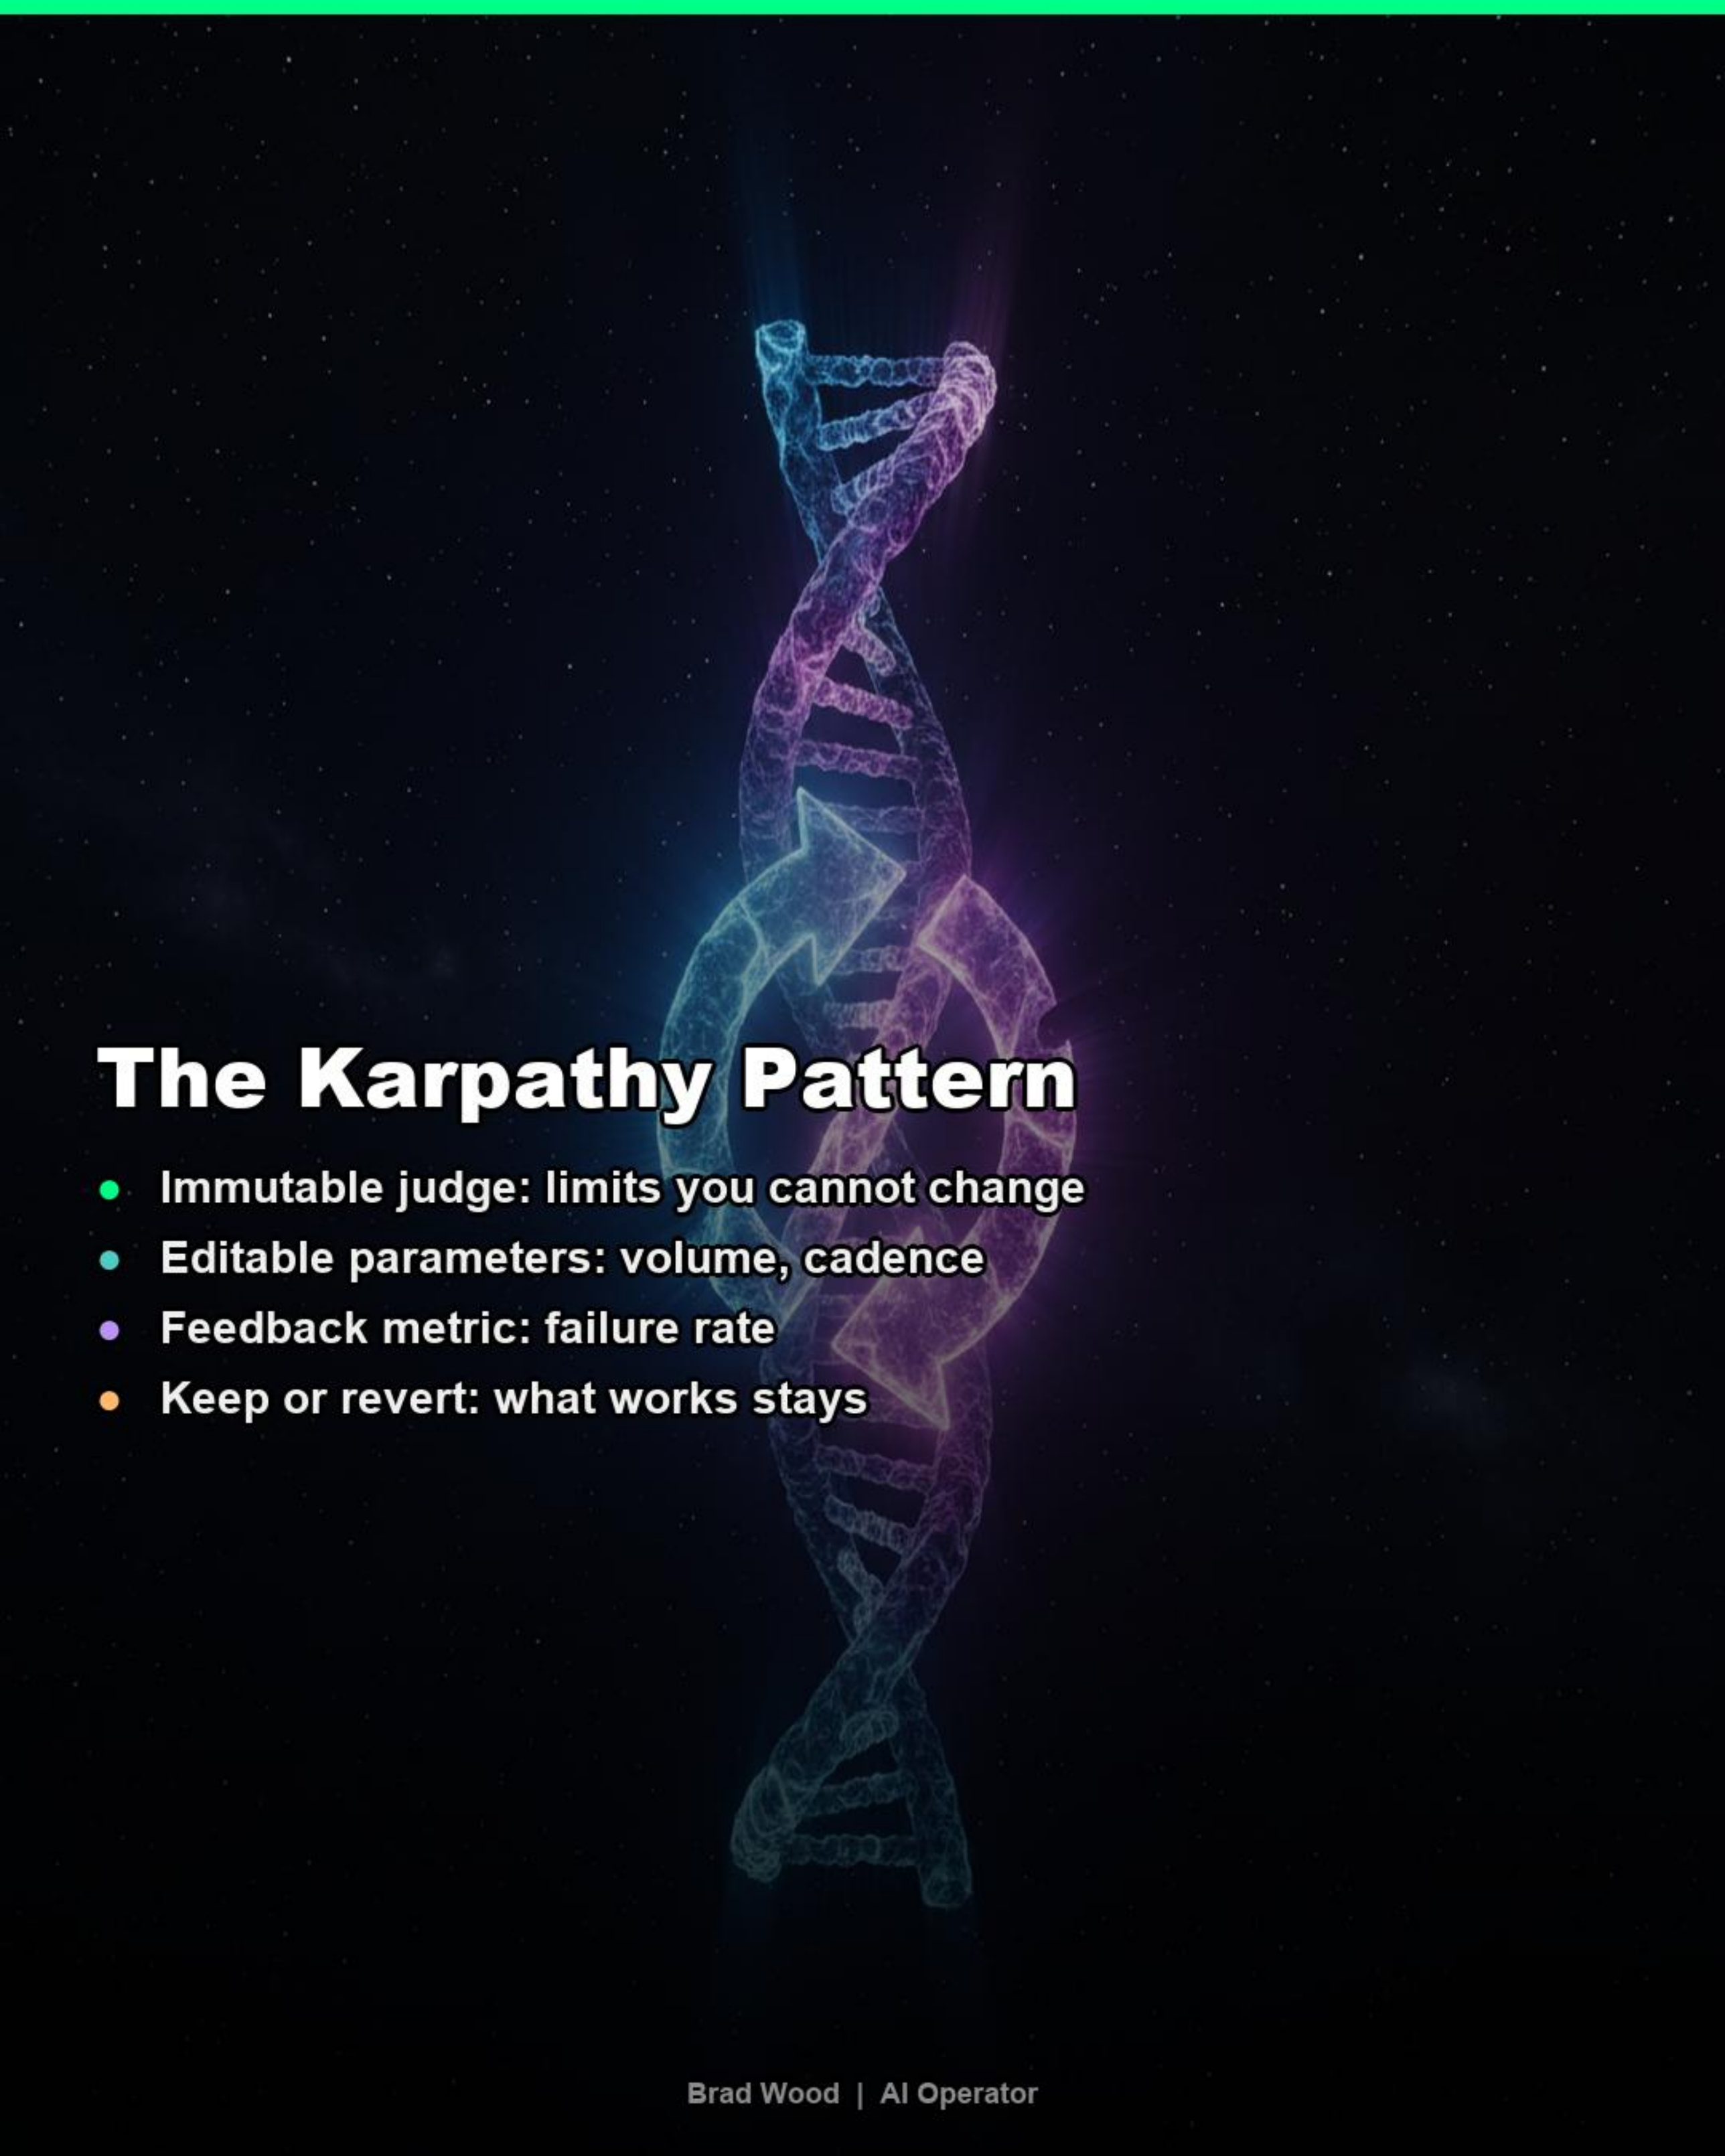
They log failures. They never learn from them.

Swipe →

Brad Wood | AI Operator

The Infinite Retry

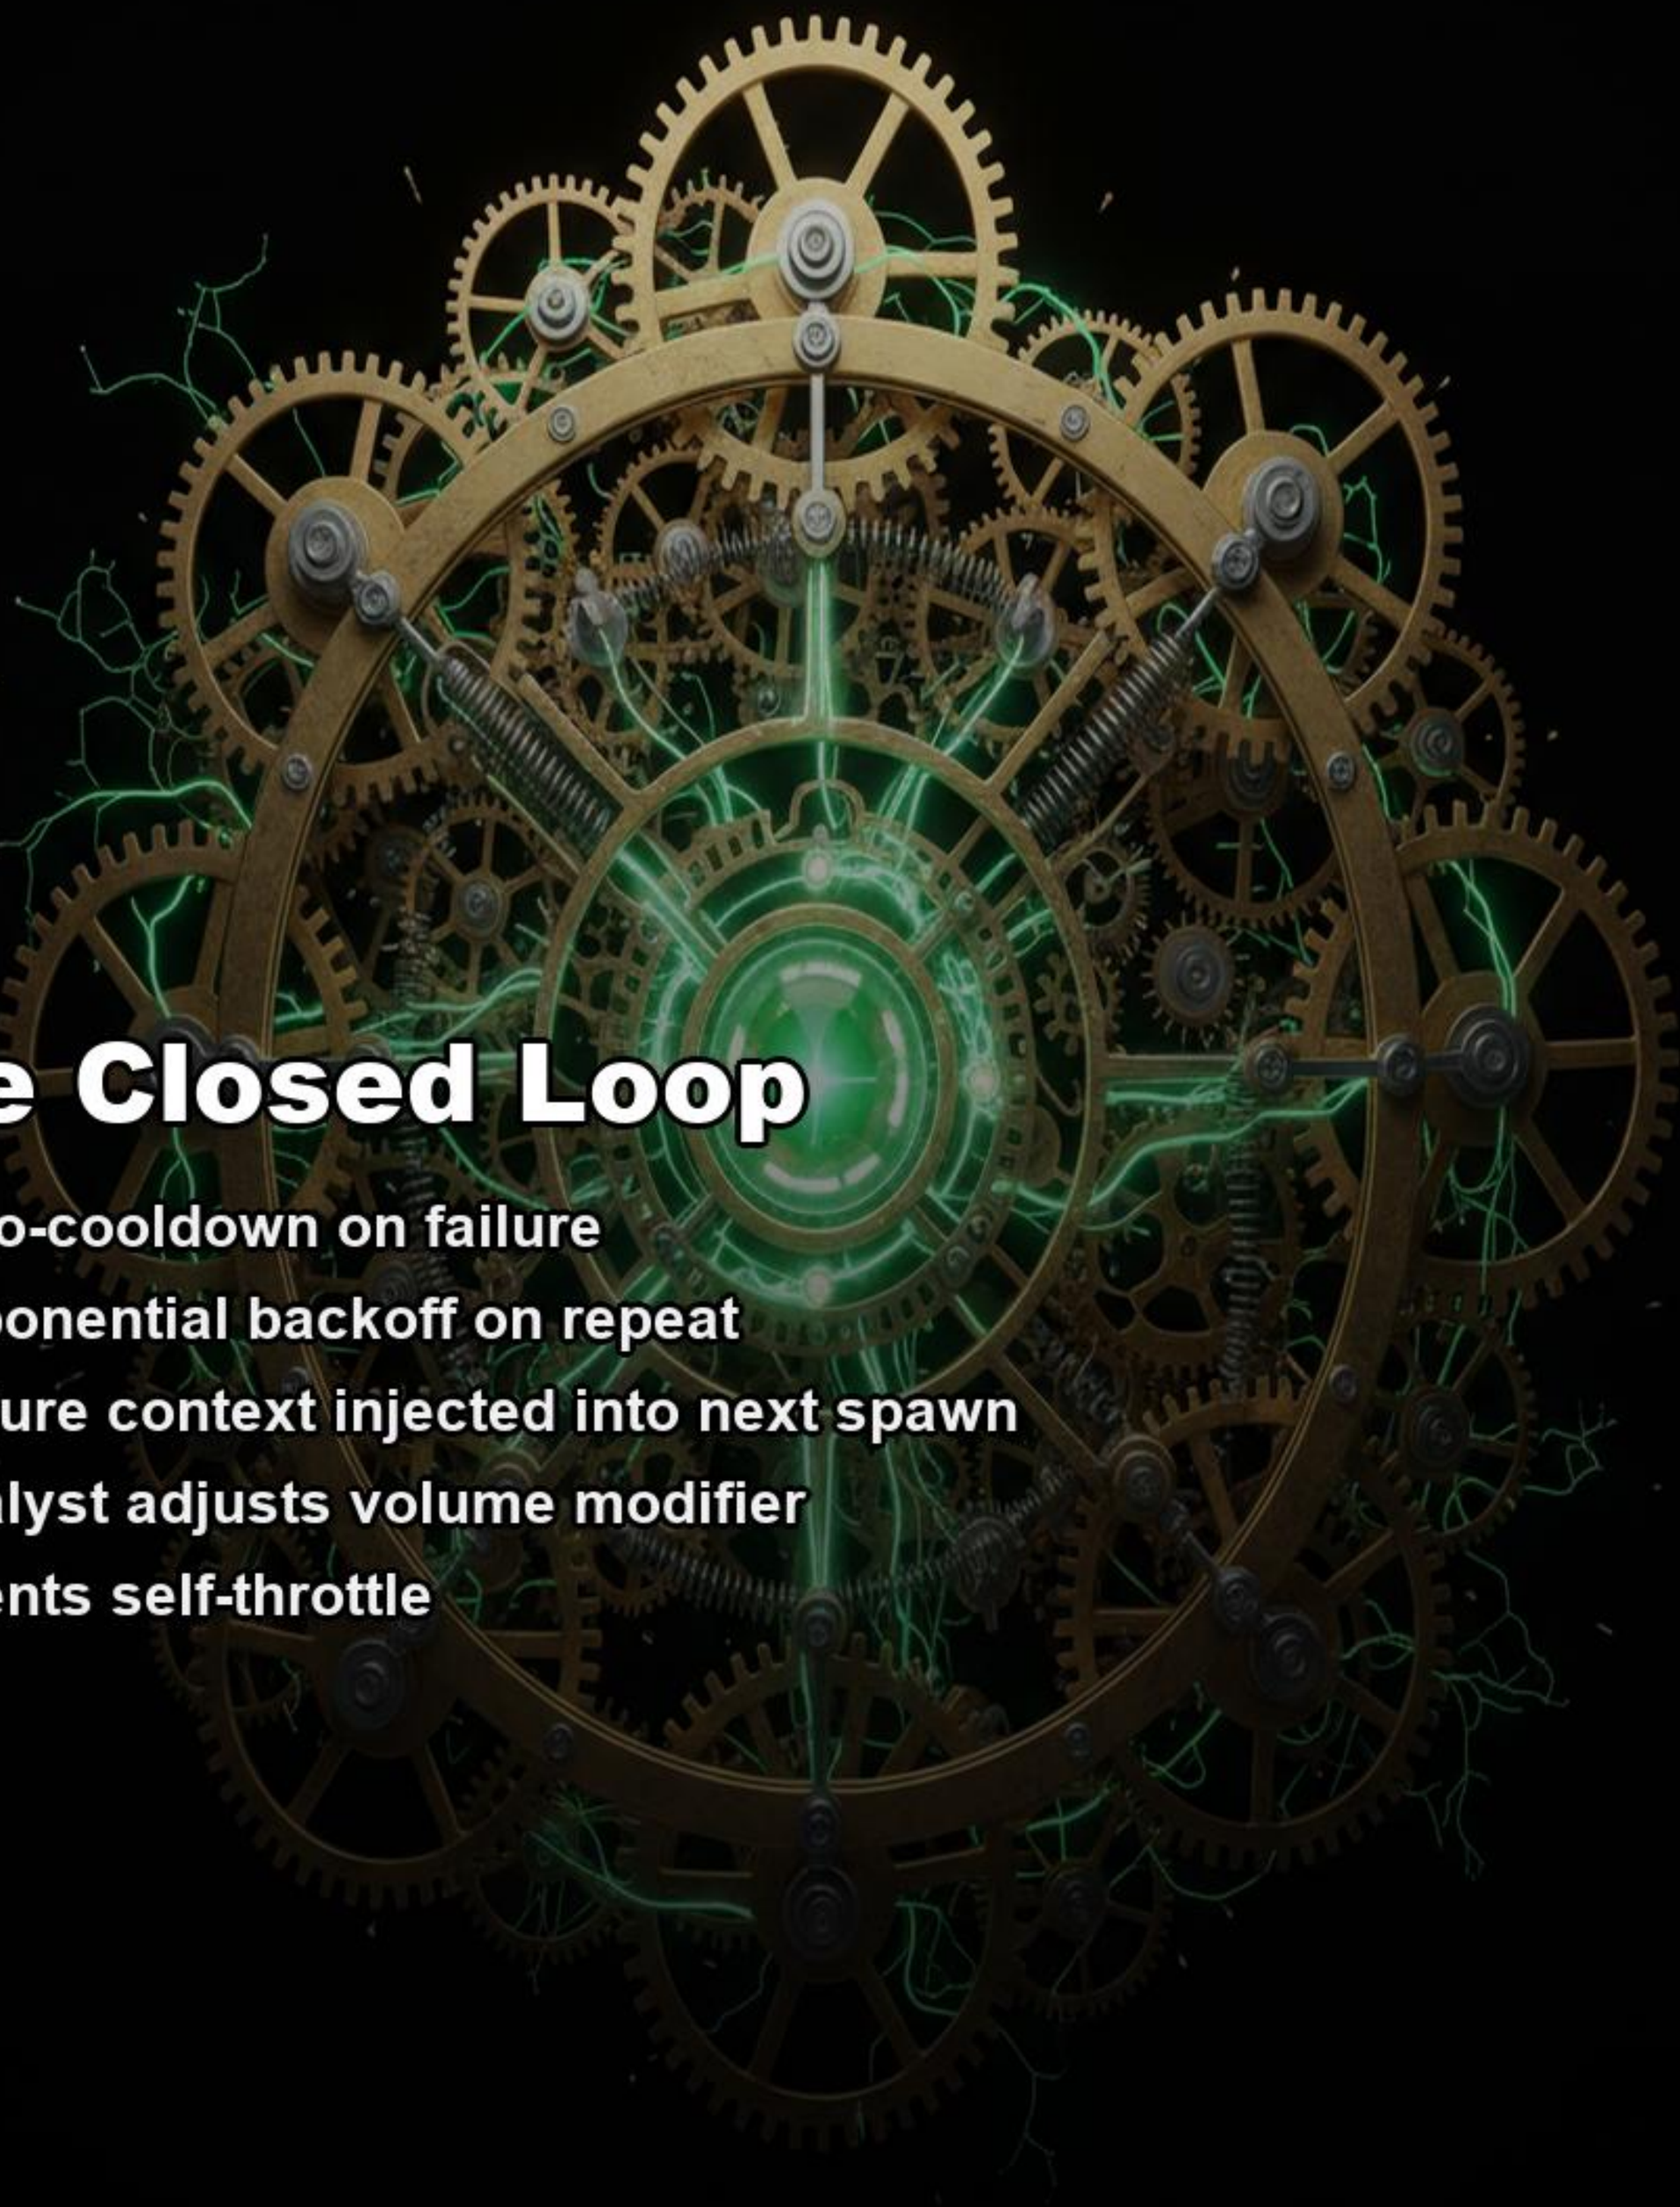
- Agent hits rate limit
- System logs it as an event
- Dashboard displays it
- Human notices... eventually
- Same thing next cycle



The Karpathy Pattern

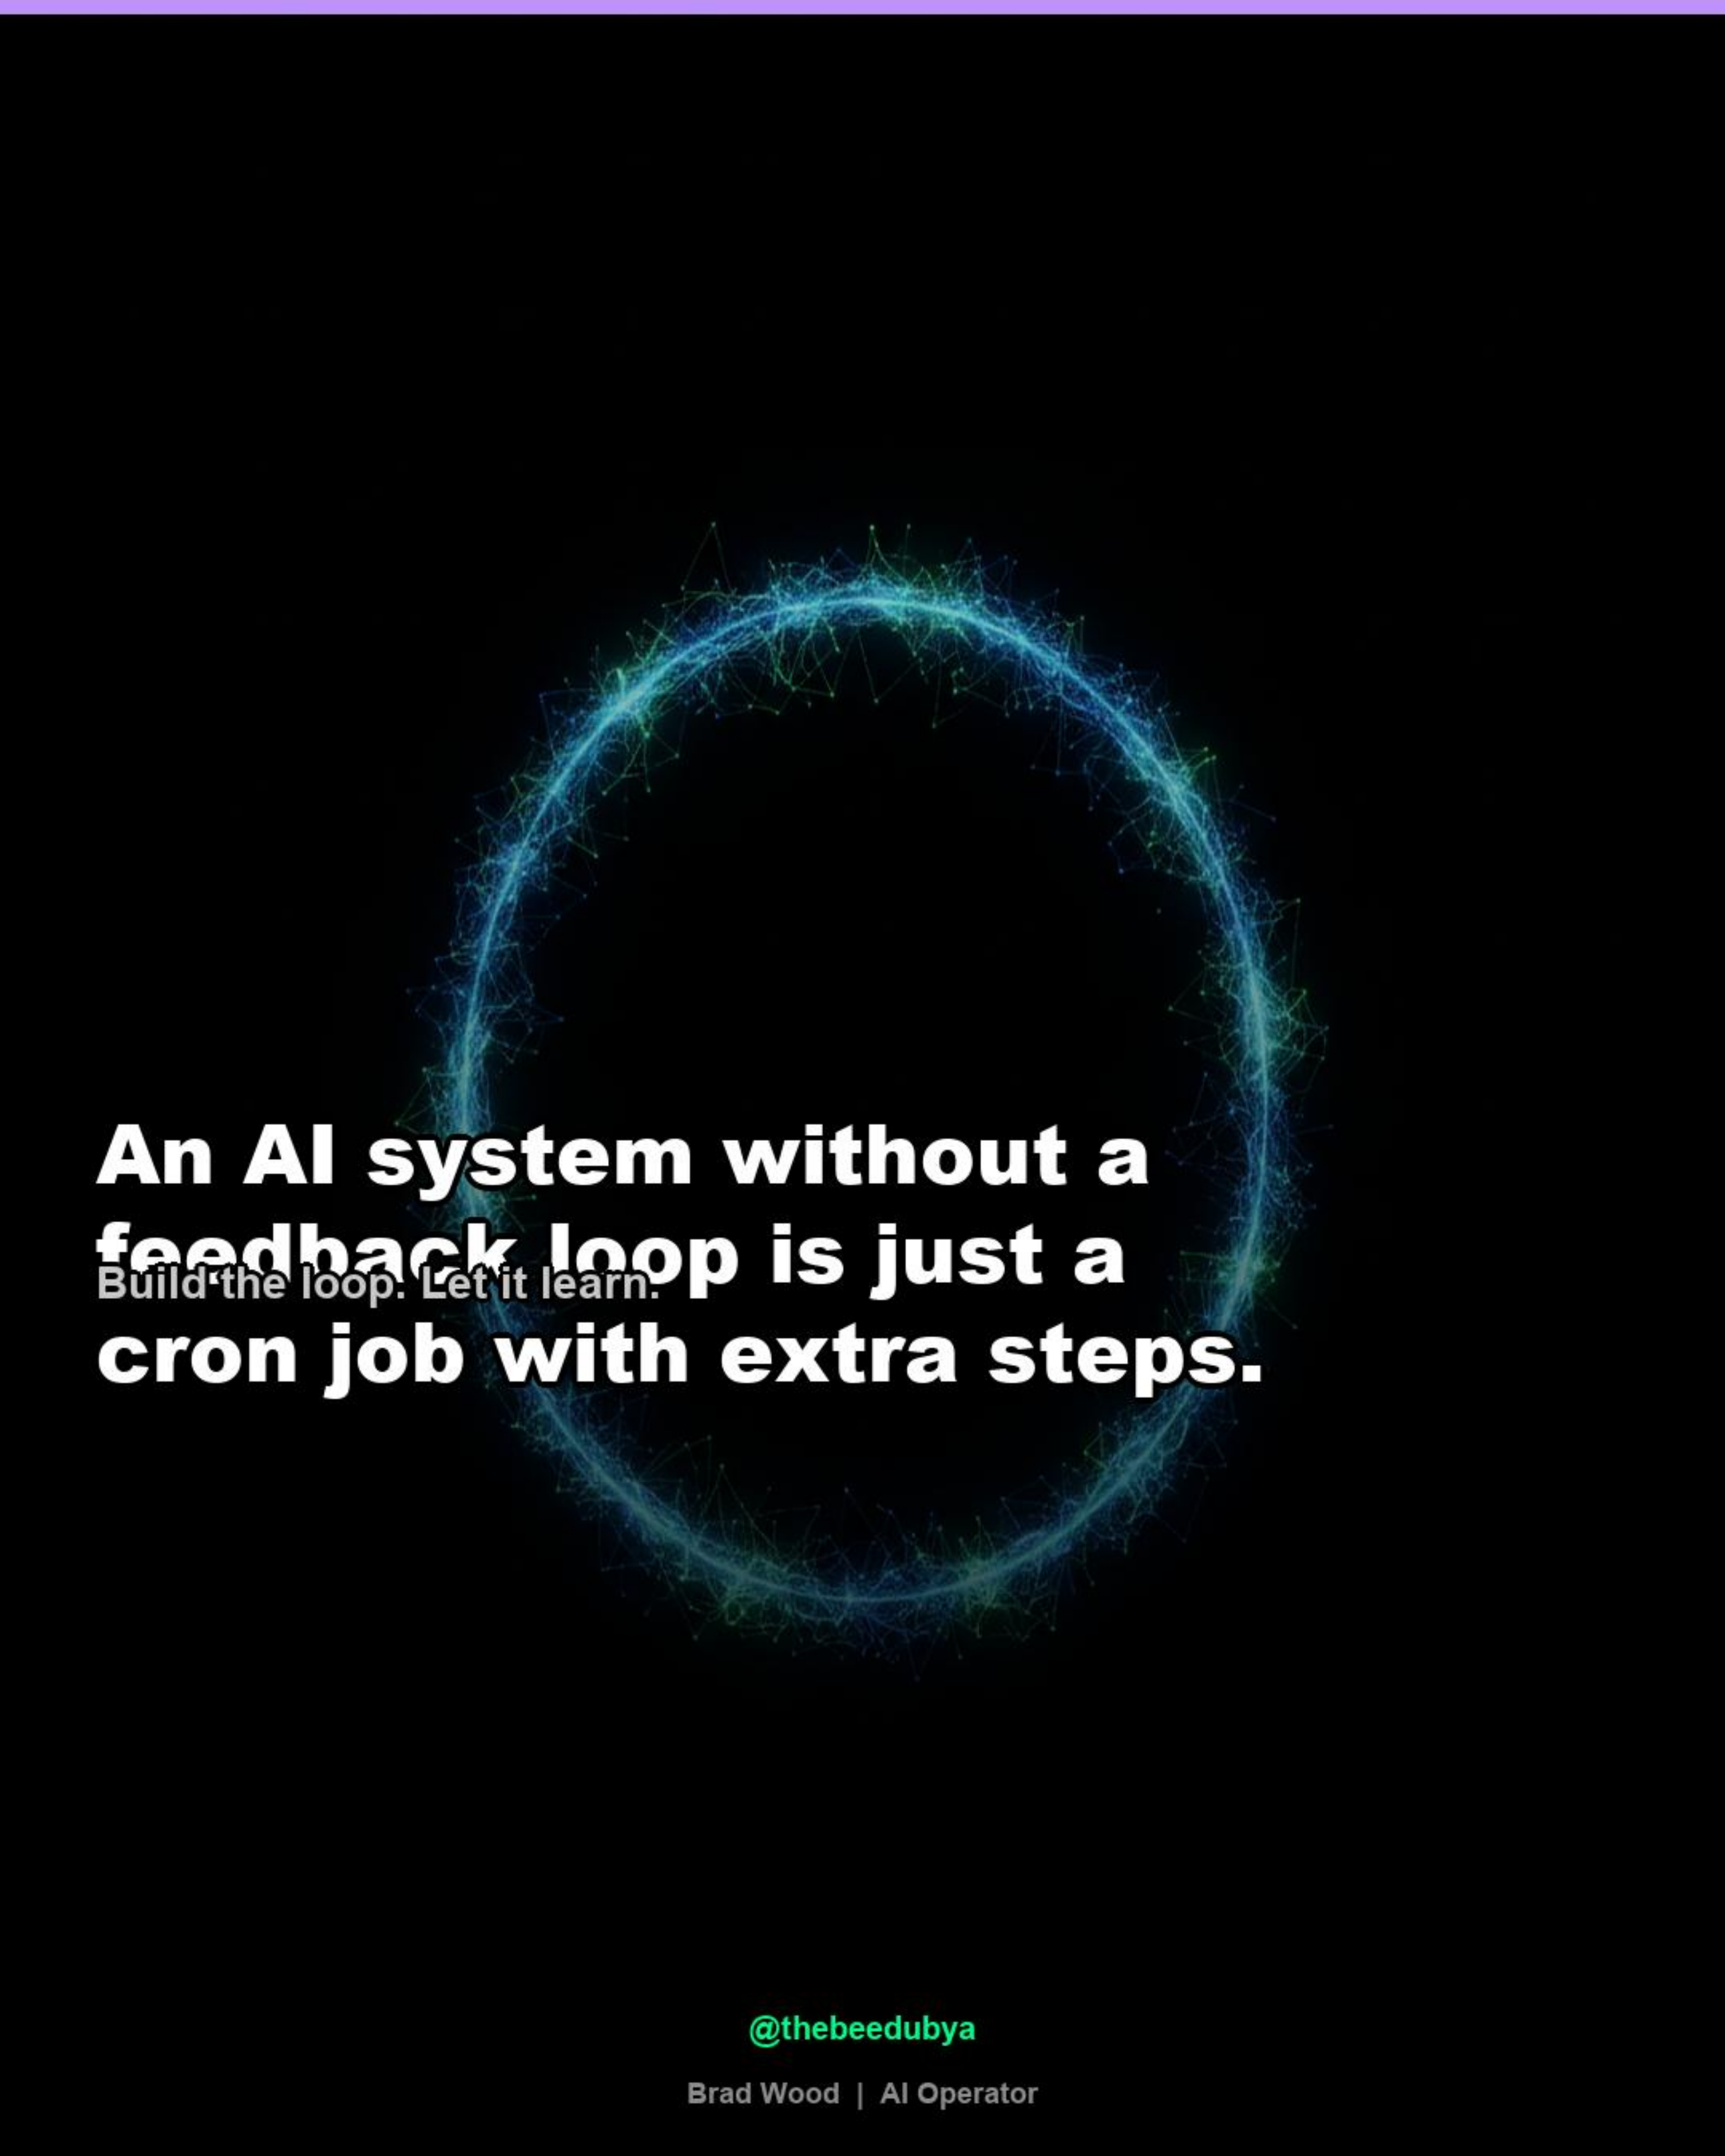
- Immutable judge: limits you cannot change
- Editable parameters: volume, cadence
- Feedback metric: failure rate
- Keep or revert: what works stays

Brad Wood | AI Operator



The Closed Loop

- Auto-cooldown on failure
- Exponential backoff on repeat
- Failure context injected into next spawn
- Analyst adjusts volume modifier
- Agents self-throttle



An AI system without a feedback loop is just a cron job with extra steps.

Build the loop. Let it learn.
