Your AI Agents Are Open-Loop

They log failures. They never learn from them. Here is the fix.

Swipe ◻

1

The Problem

- Agent hits rate limit
- System logs it as an event
- Dashboard displays it
- Human notices... eventually
- Agent does the exact same thing next cycle

2

The Karpathy Pattern

- Immutable judge: platform limits, policy gates
- Editable parameters: volume, cadence, strategy weights
- Feedback metric: failure rate
- Keep/revert: if adjustment reduces failures, keep it

59%

of our approval queue was expiring before we closed the loop

4

The Closed Loop

- Failure triggers auto-cooldown (category-specific)
- Repeat failures escalate exponentially (2x, 4x, 8x)
- Orchestrator injects failure context into next agent spawn
- Analyst detects patterns, adjusts volume modifier
- Agents read modifier and self-throttle

An AI system without a feedback loop is just a cron job with extra steps.

Build the loop. Let it learn.
