
Your AI Agents Are Open-Loop

They log failures. They never learn from them. Here is the fix.

Brad Wood | AI Operator

The Infinite Retry

- Agent hits rate limit
- System logs it as an event
- Dashboard displays it
- Human notices... eventually
- Agent does the exact same thing next cycle

The Karpathy Pattern

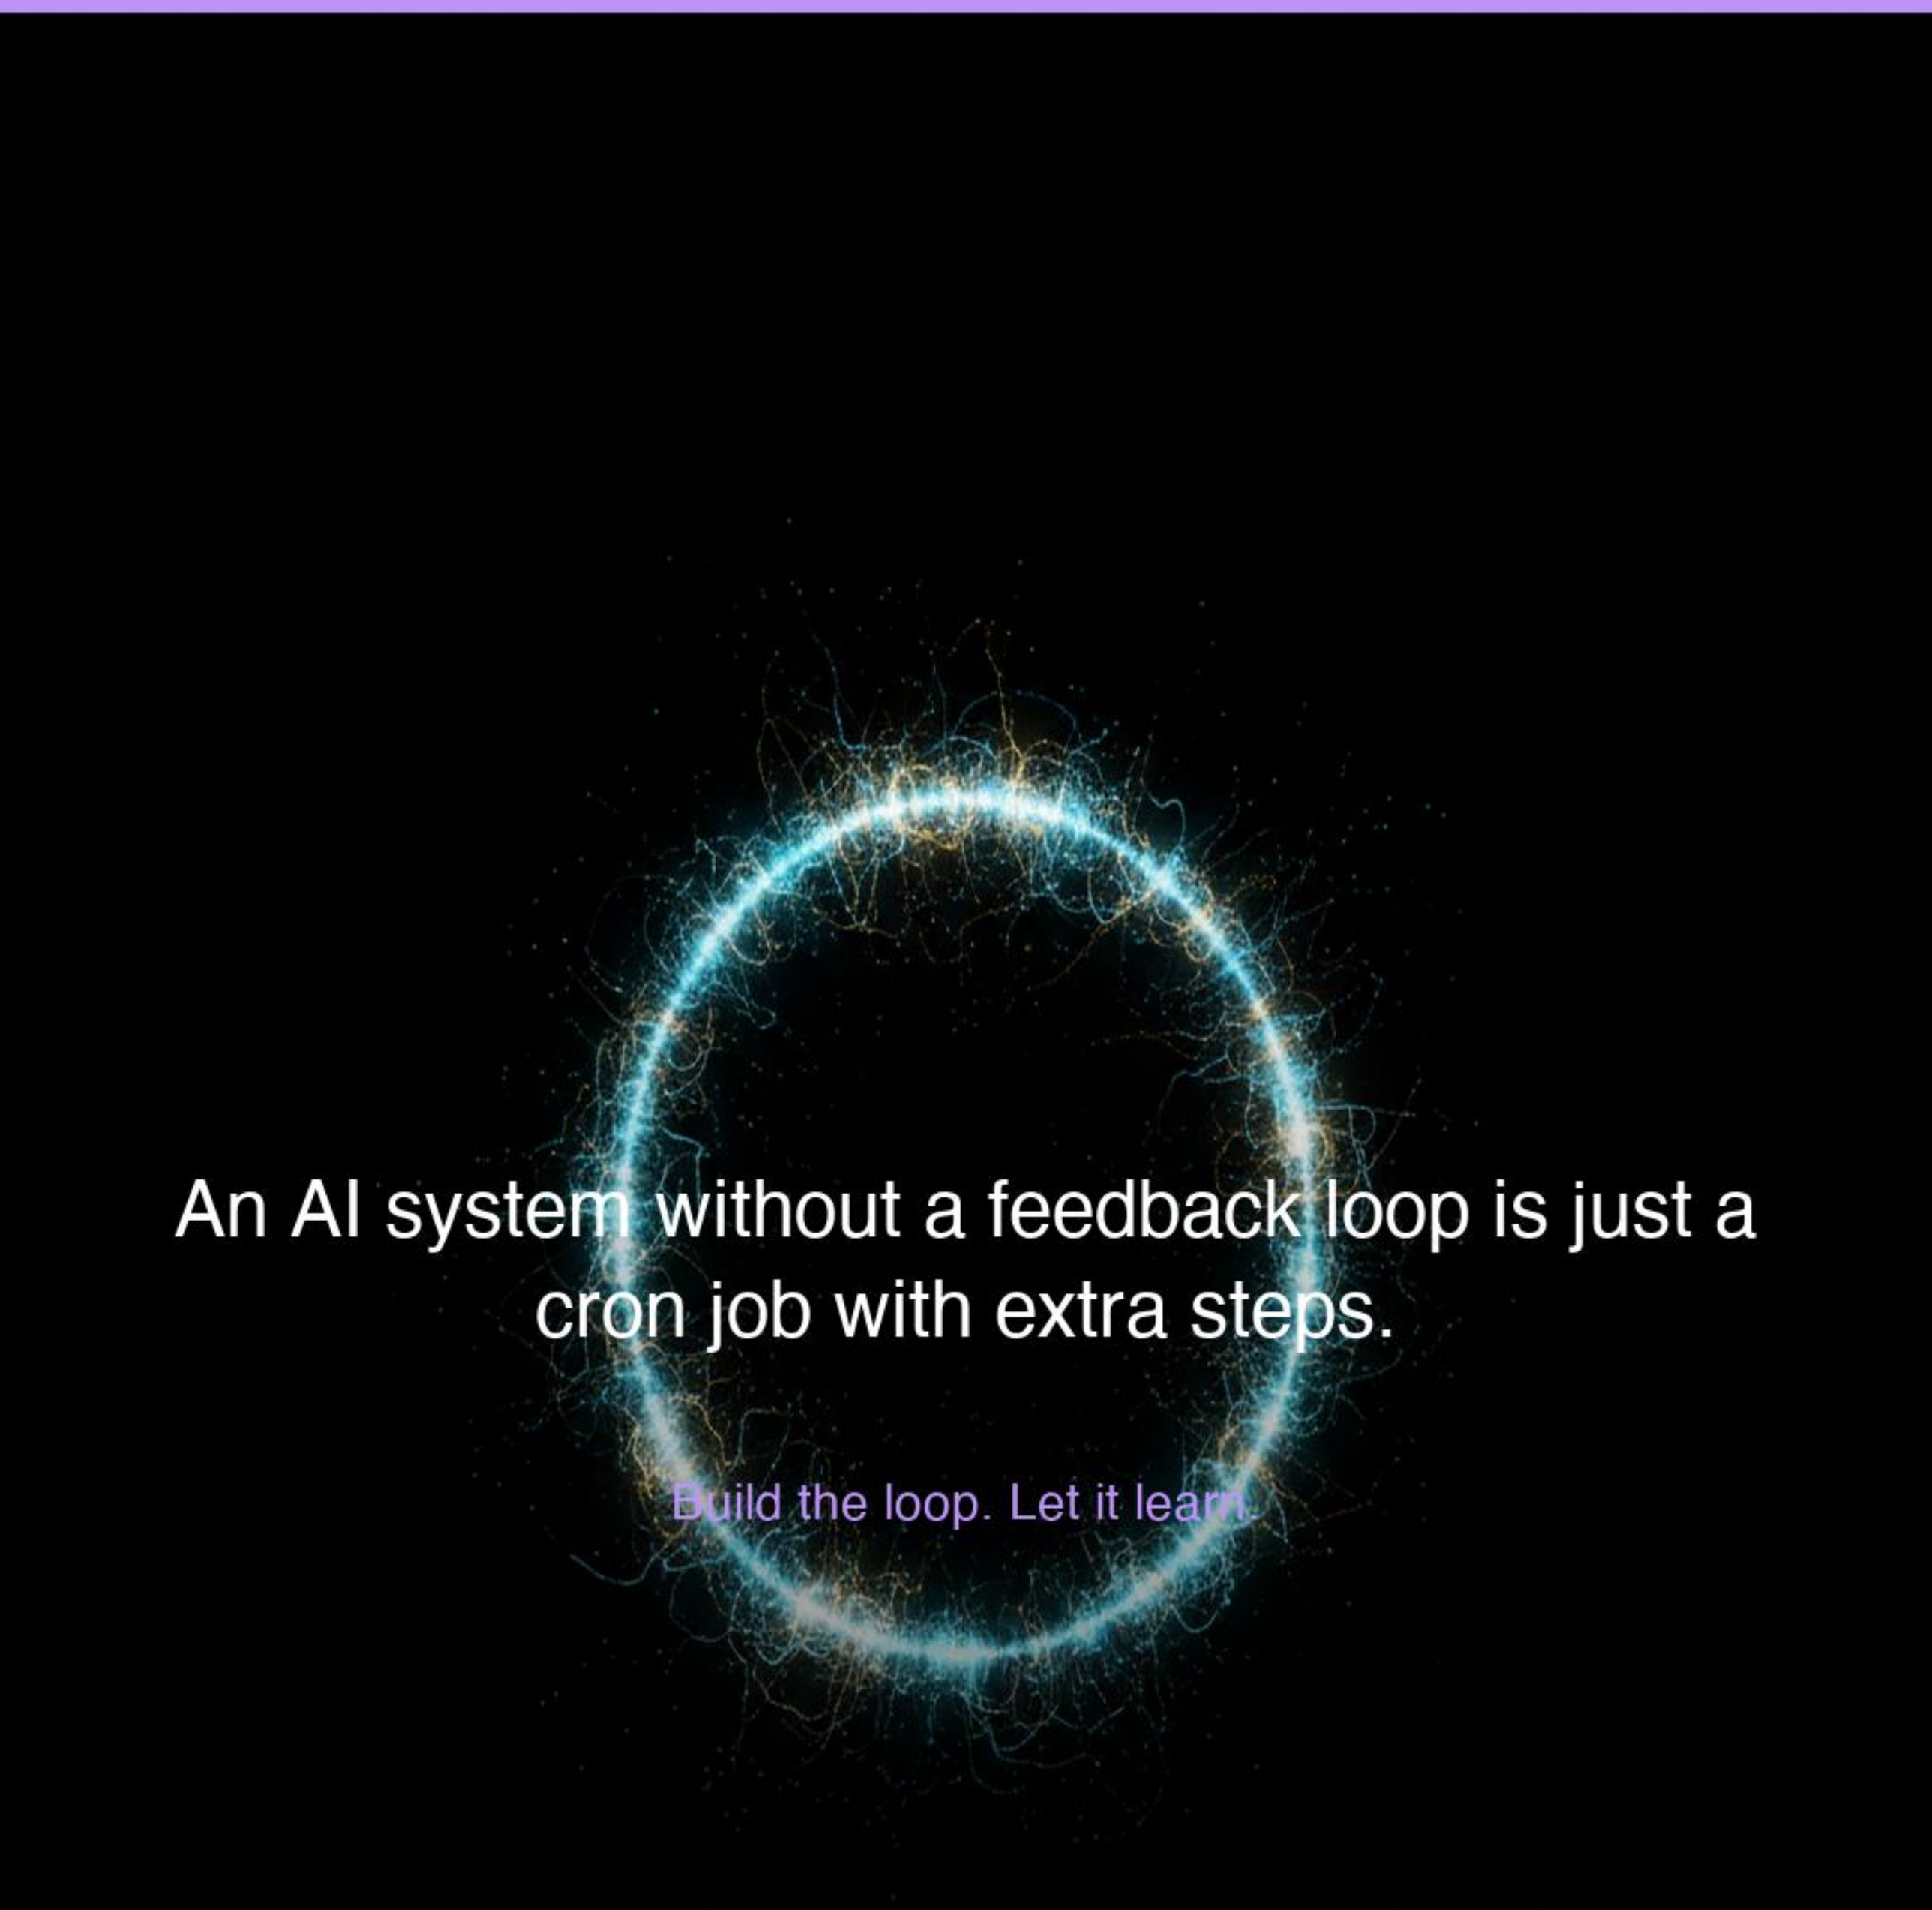
- Immutable judge: platform limits you cannot change
- Editable parameters: volume, cadence, weights
- Feedback metric: failure rate per cycle
- Keep or revert: what works stays, what fails dies

59%

of our approval queue was expiring before we closed the loop

The Closed Loop

- Failure triggers auto-cooldown
- Repeat failures escalate exponentially
- Orchestrator injects failure context
- Analyst detects patterns, adjusts volume
- Agents self-throttle



An AI system without a feedback loop is just a cron job with extra steps.

Build the loop. Let it learn.
